

AIA/SDO FITS Keywords for Scientific Usage and Data Processing at Levels 0.1, 0.3, 0.5, 1.0q, 1.0, and 1.5

(A document in progress)

Keyword Nomenclature:

 {# = Integer (~ 0-999); @ = Optional single character A-Z; & = Alpha-numeric }

LL@# Lower Left corner pixel for row (X) / column (Y) for Region of Interest (ROI) # on CCD

NAXIS@# Dimension (in pixels) along row (X) / column (Y) for ROI # on CCD

A@&&&&& Originating from telemetry data (@: H = HDR, F = FDB, I = ISP)

(Note: The definitions of the output data levels included below have been extracted in part from the Stanford SDO DRMS and SUMS computer database, as well as from Phil Scherrer's JSOC Keywords Notes and Processing Plan for Level-0.)

1. Level-0.1

1.1 Basic Image Information for Level-0.1 (and Above)

Definition of Level-0.1 (Note: The intended use of this level is for JSOC-OPS quick-look viewing in near-real time.)

1. Image Header

Metadata for Level-0, consisting of keywords derived directly from the image camera header data and those stored in a ground database containing the image characteristics, such as image size, date of observation, telescope, instrument, etc., plus that generated from the associated image status packet (ISP), including the status of mechanisms, the camera itself, the image stabilization system (ISS), and the guide telescope (GT). (See latest image status packet list)

2. Image Data

Decompressed raw data recompressed using non-lossy compression, such as gzip (see <http://www.gzip.org/>) or rice.

(Note: At Level-0.1 there will be a different series of header and image data for each camera (telescope) and possibly three series for ROIs, differentiated by the number of ROI.)

From science data packet image header (HDR) information (definition in Doc. AIA02019):

AHAPID = Packet APID (11b; from HDR)

AHTCS = Packet Time Code Seconds (32b; from HDR)

AHTCSS = Packet Time Code Sub Seconds (32b; from HDR)

AHTLFSN = Camera/Frame Serial Number (32b; from HDR)

AHTAPC = TAP Code (4b; from HDR)

AHBITID = Bit Select ID (4b; from HDR)

AHCPIDN = Compression parameter n (4b; from HDR)

AHCPIDK = Compression parameter k (4b; from HDR)

AHLUTID = Lookup Table ID (8b; from HDR)

The following 4 or 5 keywords were not defined in the flight software as of July 2008:

AHT1RN = Target 1 Row Number (7b; from HDR) for the lower-left pixel of ROI1 (to the nearest 32nd row or column)

AHT1CN = Target 1 Column Number (7b; from HDR) for the lower-left pixel of ROI1

AHT2RN = Target 2 Row Number (7b; from HDR) for the lower-left pixel of ROI2

AHT2CN = Target 2 Column Number (7b; from HDR) for the lower-left pixel of ROI2

AHFDBID = Frame Definition Block ID (8b; from HDR) (? - TBD)

It is now planned that these keywords will be in the crop table associated with each frame to be extracted from the de-crop table during the jsoc processing.

The 2 highest order bits in the 32b Frame Serial Number field will be used to specify the AIA camera (telescope) number, **CAMERA**, associated with the data image, such that

AHTLFSN = **AHTELID** (2b; telescope # -1) + **AHFSN** [Frame Serial Number (the least significant 30b)], where

AHTELID = [0, 1, 2, 3] = **CAMERA** - 1, or **CAMERA** = **AHTELID** + 1 = [1, 2, 3, 4].

The following can be obtained from Frame Definition Block (FDB) (generated and stored in the FDB database on the ground):

AFDBID = Frame Definition Block ID (8b; from FDB)

AFDBSM = SummingMode (4b; from FDB) for summing: 1x1, 2x2, 4x4 (= 0, 1, 2)

AFDBNW = NumWindows (4b; from FDB) for number of ROI windows (= 0, 1, 2)

AFNR1 = NumRows1 (16b; from FDB and crop table) for height of region 1 in pixels

AFNC1 = NumCols1 (16b; from FDB and crop table) for width of region 1 in pixels

AFNR2 = NumRows2 (16b; from FDB and crop table) for height of region 2 in pixels

AFNC2 = NumCols2 (16b; from FDB and crop table) for width of region 2 in pixels

Using the basic keywords above for the lower-left pixel of the 2 target regions of interest (ROI) and for the widths and heights of the regions, together with the following figure from the AIA Sequence Control Document (#AIA02019), where the lower-left corner pixel (LLC) is the origin with columns designated along the horizontal axis and rows along the vertical axis, the derived keywords below can be determined for each of the Region(s) of Interest (ROIs), 1, 2, and 3, in between, if the first two ROIs are overlapping in rows but not columns, as shown. It is assumed in the ROI figure below that nominal solar north direction is at the top of the figure. (This will be validated, or rotations will be made so solar north is up, in Level-0.3 when the ancillary data for instrument pointing and spacecraft pointing, roll, location, and velocity become available.)

LLC

Derived Keywords:

NUMWIN = **AFDBNW** + 'TBD' [number of window ROIs:

 = 2 for 2 ROIs ('TBD' = 0);
 = 3 for extra region when first 2 regions have overlapping rows but not columns ('TBD' = 1), as in the figure]

NAXIS1 = 4096, **NAXISX1**, total number of pixels in area, total number of pixels in area
NAXIS2 = 4096, **NAXISX2**, 0, 0 [the first 2 values of **NAXIS#** correspond, respectively, to the axis length for **NUMWIN** = 0, 1 and the last 2 values correspond to the total number of pixels in ROIs for **NAXIS1** and to zero by definition for **NAXIS2** to not confuse simple FITS file readers for **NUMWIN** = 2, 3.]

Quality/Sanity Check of FDB ID:

Does **AHFDBID** = **AFDBID** ?

Reconstructing the acquired image requires, in addition, the appropriate use of **AHCPIDN**, **AHCPIDK**, **AHTAPC**, **AHBITID**, **AHLUTID**, and **AFDBSM**. The image observation time, **T_OBS**, can be determined using discussed in Appendix 1.

More level definitions

Definition of Level-0.3 (Note: The intended use of this level is for quick-look higher-level data products in near-real time with a few minute lag from Level-0.1.)

1. Header

Metadata for Level-0.1 plus that generated or updated from ancillary information about instrument pointing and roll, spacecraft location and velocity using flight dynamics predict data (FDS), the time of the observation with respect to the spacecraft or instrument clock, and known errors in such clocks, as well as information concerning the state of the instrument, etc., to provide the lowest level of scientifically-useful data for quick look and other applications.

2. Data

Decompressed raw data recompressed using non-lossy compression, such as gzip or rice. (Same as that for Level-0.1)

(Note: Since FDS data will be available at this level, it should be possible to set **CTYPEi** to **SOLARX** and **SOLARY**, and add **CRPIXj**, **CRVALi**, and **CROTAj** estimates assuming the image is centered on the CCD.)

Definition of Level-0.5 (Note: This is a delayed but more complete version of Level-0.3, lagging real time by hours up to a day.)

1. Header

Metadata for Level-0.3 plus that updated from the final versions of SDO HK roll information and FDS data.

2. Data

Decompressed raw data recompressed using non-lossy compression, such as gzip or rice. (Same as that for Level-0.1)

Definition of Level-1.0q (Note: The intended use of this intermediate, temporary data series is to facilitate quick-look observable computations lagging real time by at most a few minutes.)

1. Header

Metadata for Level-0.3 reduced to those scientific FITS keywords needed for analysis at Level-1 plus updating the image coordinate mapping keywords to meaningful and nearly correct values.

2. Data

Decompressed raw data (level 0) calibrated by applying pixel corrections for exposure time, integer pixel shifts for alignment between telescopes, identifying bad pixels to be carried along with the image segment, as well as time-dependent, on-orbit calibrations, such as gain variations of 4 quadrants, and finally recompressed using non-lossy compression, such as gzip or rice.

(Note: At this level the following can be set: **CTYPEi**, **CRPIXj**, **CRVALi**, **CROTAj**, **R_SUN**, **X0**, **Y0**, **XCEN**, and **YCEN** to meaningful and nearly correct values.)

Definition of Level-1.0 (Note: This temporary level is generated on demand from Level-0.5 and is held for up to 60 days.)

1. Header

Metadata for Level-0.5 reduced to those scientific FITS keywords needed for analysis at Level-1 plus updating the image coordinate mapping keywords to meaningful and nearly correct values.

(Note that the data of this level are equivalent to the lowest level provided by TRACE, except for the reversible pixel and gain adjustments.)

2. Data

Decompressed raw data (level 0) calibrated by applying pixel corrections for exposure time, integer pixel shifts for alignment between telescopes, identifying bad pixels to be carried along with the image segment, as well as time-dependent, on-orbit calibrations, such as gain variations of 4 quadrants, and finally recompressed using non-lossy compression, such as gzip or rice.

Definition of Level-1.5 (Note: The output from this level will be permanently stored.)

1. Header

Metadata for Level-1.0 updated for the applied calibrations below (that have irreversibly modified the data).

2. Data

Decompressed Level-1.0 data images that are de-spiked using the bad pixel map, adjusted for plate scale and sub-pixel registration, roll corrected, as well as applied vignette and optical correcting flat fields, and finally recompressed using non-lossy compression, such as gzip or rice.

Appendix 1: AIA Camera Exposure Time Calculation

Telemetry parameters required from AIA Image Status Packet:

```

AIMGOTS = AIA_IMG_OBT_TIME_SH_SEC
AIMGOTSS = AIA_IMG_OBT_TIME_SH_SS
cmdexp = double(AIMGSHCE) = AIA_IMG_SH_CMDED_EXPOSURE
shopbc = double(AIMSHOBC) = AIA_IMG_SH_OPEN_BOT_CENTR
shopbe = double(AIMSHOBE) = AIA_IMG_SH_OPEN_BOT_EDGE
shoptc = double(AIMSHOTC) = AIA_IMG_SH_OPEN_TOP_CENTR
shopte = double(AIMSHOTE) = AIA_IMG_SH_OPEN_TOP_EDGE
shclbc = double(AIMSHCBC) = AIA_IMG_SH_CLOSE_BOT_CENTR
shclbe = double(AIMSHCBE) = AIA_IMG_SH_CLOSE_BOT_EDGE
shcltc = double(AIMSHCTC) = AIA_IMG_SH_CLOSE_TOP_CENTR
shclte = double(AIMSHCTE) = AIA_IMG_SH_CLOSE_TOP_EDGE

```

AIMGSHCE is the commanded exposure (19 bits) starting from ~0.005 s (due to size of narrow shutter slit) in 0.001 s steps to 524.28 s [$(2^{19} - 1) * 10^{-3} = 524287 * 10^{-3}$] (timings are from document AIA01259 rev H). The maximum exposure of the AIA shutter mechanism is ~268.4 s. The 24 bit shutter open and close time measurements have a resolution of 0.000004 s, starting at 0.000004 s up to ~67 s [$(2^{24} - 1) * 4 * 10^{-6} = 67108860 * 10^{-6}$]. The commanded exposure value can be used to determine the rollover value. The expected value of the commanded exposure to the nearest 0.1 sec just before each of the three possible rollover steps is 67.1 s, 134.2 s, and 201.3 s, respectively. When **AIMGSHCE** is above any of these values it has rolled over 1, 2, or 3 times, respectively, and the number of rollovers multiplied by 67.108864 s needs to be added to the respective shutter close minus open time before averaging. Please note that the programmer needs to take care near the rollover steps because the hardware and/or software may not work quite the same as in the ideal case presented here.

The actual exposure is the average of the difference of the closing time minus the opening time for each of the four measurements positions, except when **AIMGSHCE** is less than 0.072 s, in which case the shutter mechanism is in its narrow slit mode. In the latter mode the narrow slit opening (smaller by 0.35) is utilized for one or more passes. Current operational planning calls for the shutter exposure to be about 5 s per image for each camera.

Using the above, together with Rock Bush's email of 28-Feb-08 on HMI T_OBS and EXPTIME and John Serafin's email of 20-May-08 on a rollover algorithm in C, the following algorithm has been written in IDL for calculating the AIA camera shutter exposure time for each camera, **EXPTIME**; standard deviation, **EXPTIME_SD**; the shutter open start time plus the middle of the exposure time, **T_OBS**; and the date when the observation started, **DATE_OBS**.

; Computer quantities (note: all variables should be double precision and time is in seconds):

AIA_Shutter_Open_Start_Time = *AIMGOTS* + *AIMGOTSS* ; combine these in TAI

;Intermediate calculation variables:

cshclbc = shclbc + 67.108864d0 * nrollct(cmdexp, shclbc) ;correct for rollovers
 cshclbe = shclbe + 67.108864d0 * nrollct(cmdexp, shclbe)
 cshcltc = shcltc + 67.108864d0 * nrollct(cmdexp, shcltc)
 cshclte = shclte + 67.108864d0 * nrollct(cmdexp, shclte)

shebc = cshclbc - shopbc ;close time - open time
 shebe = cshclbe - shopbe
 shetc = cshcltc - shoptc
 shete = cshclte - shopte

mean = (shebc + shebe + shetc + shete)/4.0d0 ;mean and standard deviation
 exp_sd = sqrt(1/3 * ((shebc-mean) * (shebc-mean) + (shebe-mean) * (shebe-mean) + \$
 (shetc-mean) * (shetc-mean) + (shete-mean) * (shete-mean))) ;continued from previous line

if (cmdexp lt 0.072d0) then begin ;in narrow slit mode
 mean = mean * 0.35
 exp_sd = expsd * 0.35
 endif

EXPTIME = mean ;AIA_Shutter_Exposure_Time
EXPTIME_SD = exp_sd ;AIA_Shutter_Exposure_SD

EXPTIME_Offset = (cshclbc + shopbc + cshclbe + shopbe + cshcltc + shoptc + cshclte + \$
 shopte)/8.0d0 ;continued from previous line

T_OBS = AIA_Shutter_Open_Start_Time + EXPTIME_Offset ;(add in seconds, calculate
 DATA_OBS, then convert T_OBS to UTC)

DATE_OBS = **T_OBS** - (**EXPTIME**/2.0) ;(add in seconds then convert to
 UTC time)

Note: the T_OBS time is the shutter open start time plus the middle of the exposure time. As such a shutter exposure offset is the mean of all the open and close times. The EXPTIME is the shutter open time duration. DATE_OBS is the date when observation started.
